FOREIGN KEY(p\_id) REFERENCES Purchase(p\_id)  
FOREIGN KEY(email) REFERENCES Customer(email)

## Stored Procedure

- (a) This stored procedure increases the discount of products that haven't been sold in the past year by 10%. The maximum discount is however a parameter to the procedure. For example, if the maximum discount is 25%, a product that already more than a 15% discount (and less than 25%) will have its discount updated to 25%, not more. Otherwise a product that has less than 15% discount will get a 10% discount increase.

(b)

```
CREATE OR REPLACE PROCEDURE DiscountInactiveProducts(IN
    max_discount INT)
BEGIN
    DECLARE done INT DEFAULT 0;
    DECLARE current_pid INT;
    DECLARE current_discount INT;

    DECLARE product_cursor CURSOR FOR
        SELECT p_id, COALESCE(discount_pourcentage, 0)
        FROM Product
        WHERE COALESCE(discount_pourcentage, 0) < max_discount;

    DECLARE CONTINUE HANDLER FOR NOT FOUND SET done = 1;

    OPEN product_cursor;

    FETCH product_cursor INTO current_pid, current_discount;

    WHILE done = 0 DO

        IF NOT EXISTS (
            SELECT 1
            FROM Contains_purchase cp
            JOIN Purchase pur
            ON cp.purchase_id = pur.p_id
            WHERE cp.product_id = current_pid
            AND pur.p_date >= CURRENT DATE - 6 MONTHS
        ) OR NOT EXISTS (
            SELECT 1
            FROM Contains_purchase cp
            WHERE cp.product_id = current_pid
        ) THEN
            IF (current_discount + 10 > max_discount) THEN
                SET current_discount = max_discount;
            ELSE
                SET current_discount = current_discount + 10;
            END IF;

            UPDATE Product
            SET discount_pourcentage = current_discount
            WHERE p_id = current_pid;
        END IF;

        FETCH product_cursor INTO current_pid, current_discount;

    END WHILE;

    CLOSE product_cursor;
END
```

(c)

Calling the procedure

```
db2 => CALL DiscountInactiveProducts(25);
```

```
Return Status = 0
```

First 25 before calling procedure:

```
db2 => SELECT p_id, discount_pourcentage FROM Product WHERE p_id <= 25;
```

P_ID	DISCOUNT_POURCENTAGE
1	10
2	15
3	0
4	20
5	10
6	0
7	25
8	30
9	12
10	5
11	15
12	20
13	8
14	10
15	18
16	7
17	22
18	10
19	15
20	12
21	9
22	20
23	5
24	30
25	5

```
25 record(s) selected.
```

Products with ids less than 25 after calling procedure:

```
db2 => SELECT p_id, discount_pourcentage FROM Product WHERE p_id <= 25;
```

P_ID	DISCOUNT_POURCENTAGE
1	10
2	15
3	0
4	20
5	10
6	0
7	25
8	30

19	15
20	12
21	19
22	25
23	15
24	30
25	15

25 record(s) selected.

## Application Program

### Indexing

#### Index 1

```
db2 => CREATE INDEX clustered_purchase_idx ON Purchase(p_date) CLUSTER;  
DB20000I The SQL command completed successfully.
```

- (a)
- (b) A clustered index on purchase date in the Purchase table is beneficial because purchases are frequently analyzed based on dates and date ranges. Thus, sorting the purchases by date allows for efficient range queries, making it faster to access data for accounting purposes. An example query that would benefit from this index is the following:

```
SELECT SUM(amount) AS total  
FROM Purchase  
WHERE p_date >= '01/01/2025' AND p_date <= '12/31/2025';
```

This above query computes the total revenue for the year 2025. With this clustered index, the database can quickly locate the first matching row, and perform a sequential scan to retrieve all rows within the specified date range, without needing to follow the pointers of other data entries (value + rid), as in a non-clustered index, which could often lead to more IO.

## Index 2

(a) `db2 => CREATE INDEX stock_idx ON Has_in_stock(s_id, quantity) CLUSTER;`  
DB20000I The SQL command completed successfully.

- (b) This index is on the s\_id and quantity attribute of the Has\_in\_stock table. It is useful for this application to efficiently identify products that are running low in stock in a specific store, which is crucial for inventory management. An example query that would benefit from this index is the following:

```
SELECT p_id
FROM Has_in_stock
WHERE s_id = 0 AND quantity < 5;
```

This query identifies all products of a particular store where the quantity of the product is very limited. The fact that it is a clustered index, again, allows for efficient range queries, making it faster to access data for inventory management purposes. It also makes sense to use a clustered index because the other attributes of the table are id's, which are certainly not needed in a sorted order.
